WIKA – YOUR RELIABLE PARTNER

Whether in metal processing, water treatment, medicine and healthcare or firefighting: modern industrial and medical gas supply technologies enable us to store, distribute and use compressed and liquefied air and chemical gases efficiently and sustainably. All the gas applications listed are subject to stringent standards and regulations. In this context, a high level of occupational safety, energy and labour cost savings and the optimisation of supply chain costs are required. To meet these challenges, WIKA offers manufacturers, distributors and operators of industrial gas equipment a comprehensive range of measuring instruments to cover a wide range of requirements.

As the market leader in measurement technology, we support your transformation with a broad portfolio of innovative and high-precision products, IIoT solutions and services, which we are continuously developing with more than 100 development engineers. Together with our global service and distribution network and our own production, we offer smart, efficient and sustainable top quality for your requirements. In this way, we can continue to grow together. That is “Smart in sensing” and you can rely on it now and in the future.

Alexander Wiegand,
Chairman and CEO, WIKA

CRYOGENIC TANKS

Measuring instruments in cryogenic tanks, ISO containers and tank trailers are used to monitor the level of cryogenic gases. Pressure indicating instruments normally show the absolute pressure or differential pressure. Measuring instruments in tank trailers, in addition, show the pressure before and after the cryogenic pump.

On request from OEM manufactures and gas companies, tanks and trailers are equipped with integrated or stand-alone transmitters. Our customers in this field are manufacturers of cryogenic vessels, companies maintaining and refurbishing cryogenic vessels, industrial gas companies, companies leasing ISO containers and suppliers of associated cryogenic monitoring systems.

WELDING AND OTHER INDUSTRIAL EQUIPMENT

Pressure measuring instruments with a Bourdon tube are frequently used in welding regulators. Such measuring instruments are used in conventional regulators in the traditional “mickey mouse” design as well as in regulators with flow meters, and also as an integrated component in the plastic case of a regulator unit.

One measuring instrument shows the pressure in the gas cylinders and the other one the regulated pressure in the gas distribution line.

With the exception of traditional welding applications with brass regulators, such measuring instruments on nickel-plated regulators can be used in laboratories and in the specialty gas industry and drinks distribution.

Users in this field are OEM valve manufacturers, gas companies, distributors and manufacturers of welding, beverage and other industrial equipment.

VALVES WITH INTEGRATED PRESSURE REGULATORS (VIPR)

WIKA cooperates with several renowned valve and regulator manufacturers. As time has passed, the design of regulators has become ever more complex in order to ensure higher protection and better utilisation of the measuring instruments.

This has led to the development of measuring instruments that are directly integrated in the valves (VIPR = valve with integrated pressure regulator). Initially as mechanical, and then later as mechatronic/electronic instruments.

The task of measuring instruments in such regulators is to indicate the pressure in a gas container and in the supply line. Modern electronic versions can indicate the remaining usage time, the gas flow rate and the level and also send an alarm when gas contents are low and communicate this wirelessly.

GAS CABINETS

Gas cabinets are used for firefighting. The gas cylinders contain inert, non-reactive and non-toxic gases. The market offers a variety of gas cabinets in different configurations, e.g. 1-, 2- and 3-cylinder designs (or based on company configuration). They can be either new, used or reconditioned.

A gas cabinet can have different features depending on the specific gas. These features include a gas sensor, a sprinkler head, an overflow sensor, automatic operation with automatic purging and overpressure sensor. The connection and valve specifications for gas cabinets and distribution systems are important in selecting the correct measuring and transmitting instruments.

MEDICAL GASES

Whether in the emergency room, the operating room, the intensive care unit, the hospital ward or in ambulance vehicles: Medical gases are widely used in hospitals. There is a variety of medical gases: medical air, carbon dioxide (CO₂), helium (He), laughing gas (N₂O), nitrogen (N₂), nitrogen monoxide (NO), oxygen (O₂), xenon.

To secure smooth supply and distribution of gases, measuring instruments are installed on gas storage tanks or cylinders, valve manifolds, pressure controllers, closure control cabinets as secondary regulators at gas distribution systems and at user stations. For vacuum monitoring, pressure gauges are used. Our customers in this area are gas companies, manufacturers of medical devices and also manufacturers of pressure reducers for medical applications.

HYDROGEN

Because of its calorific value, hydrogen is often used as fuel. Hydrogen fuel cells generate electricity from oxygen and hydrogen. Fuel cells are used in automobiles, spacecraft, remote weather stations and submarines. Other uses for hydrogen are in the fertiliser and paint industries, in laboratories, in the food industry and the chemical industry. Hydrogen is also used in welding processes. TIG welding and plasma welding are particularly noteworthy here.

Hydrogen is required as a reducing agent in chemical industries. Hydrogen has higher requirements for material stability than other gases. Our customers who use instruments in hydrogen applications are often in the automotive industry, the manufacturing of fuel stations, gas supply systems, test benches for laboratories, gas analysing equipment, etc.

LPG, LNG AND CNG ACCESSORIES

When travelling with a natural gas fuelled car one can save up to 60 % on fuel costs. Moreover, natural gas is one of the cleanest energy sources: It generates no unburned hydrocarbon emissions, which are considered hazardous and carcinogenic, and reduces CO₂ emissions by 20 %.

This is why these vehicles are allowed on roads on which others are not. Wika measuring instruments are used to indicate the level of compressed (CNG) or liquefied (LNG) natural gas inside of a tank.

LPG – liquefied petroleum gas – is another fuel gas alternative, increasingly used not only in vehicles but also, for example, in heating systems and cooking appliances.

PROTECTIVE BREATHING APPARATUS

Protective breathing apparatus are often referred to as self-contained breathing apparatus (SCBA), compressed air breathing apparatus (CABA) or simply breathing apparatus (BA).

Protective breathing apparatus is worn by rescue workers, firefighters or others to provide breathable air in life-threatening or unhealthy atmospheres.

The pressure gauges from WIKA are installed on the valve of the breathing apparatus cylinder or on a mobile hand-held instrument. They are used to display the oxygen remaining in the cylinder, so that appropriate measures can be taken in good time. WIKA supplies its products to leading international manufacturers of protective breathing apparatus.

GAS SUPPLY AND CONTROL SYSTEMS

In the gas industry, where safety and reliability are of critical importance, the correct regulators equipped with appropriate measuring and control instruments are vital to regulate gases precisely.

The control is ensured through a system of regulators, mechanical measuring and switching instruments as well as transmitters. For these applications, WIKA supplies products to industrial gas companies and manufacturers of gas supply systems (e.g. point-of-use panels, primary pressure control panels etc.), particularly in the speciality gas and chemical industries.

CYLINDER/VALVE MANIFOLDS

A cylinder manifold is a group of gas cylinders, commonly used to supply gases via a pipeline. Via a valve manifold, the cylinders are often grouped into a primary and a secondary bundle. Initially, the gas from the primary bundle is used first, where the gas is consumed equally from all cylinders, as they are connected in parallel through a common outlet.

Once the levels in the cylinders are sufficiently low, a pressure gauge with switch contacts (PGS) or a pressure transmitter switches to the secondary valve manifold, so that the primary cylinder bundle can be exchanged. Valve manifolds are used to supply gas from one central source to different usage points. In hospitals, for instance, manifolds are used to supply nitrous oxide, Entonox or oxygen.

GAS-BASED FIRE SUPPRESSION SYSTEMS

The firefighting industry covers a variety of applications in industrial, commercial and residential markets. This typically functions in one of two ways: The first reduces the oxygen content in the atmosphere to a level where self-sustained combustion can no longer occur. The second is to react chemically with the fire-absorbing heat and initiate a chain reaction that stops the combustion.

Gas-based fire suppression systems (CO₂, FM200®, Novec™, Inergen®, Argonite) are a critical component for protecting property and human life in a wide range of buildings such as apartments, data centres, hospitals, hotels, parking garages, restaurants and universities as well as in manufacturing and processing plants.

The task of pressure gauges is to monitor and trigger an alarm when the pressure in gas cylinders deviates from the required values. To use instruments in stationary systems, a VdS or LPCB approval is required. In contrast, pressure switches for mobile firefighting systems do not need this approval. Here WIKA works in close cooperation with OEMs in the firefighting industry and with valve manufacturers.

NITROGEN AND OXYGEN GENERATORS

Nitrogen and oxygen generators represent a viable alternative to on-site generating and storing oxygen and nitrogen for laser cutting, electronics, shipping, healthcare or the beverage industry. Generators substitute and eliminate the use of rented high-pressure gas cylinders.

Measuring instruments in generators are used to define the gas flow in the take-off line as well as to monitor the pressure swing adsorption process (PSA) and, alternatively, to monitor the pressure inside the vessel, where the required

gas is generated. Here, both mechanical pressure gauges (with liquid filling) as well as transmitters are used.

Oxygen or nitrogen generators consequently can be connected to a gas dryer and/or compressor that would be filling produced gases into intermediate high-pressure storage bundles.

GAS MIXERS

Gas mixers, also named gas blenders, are systems able to mix two or more gases from gas cylinders. The gas mixture produced allows to avoid using expensive premixed gas cylinders.

The major application is to obtain bi- or tricomponent gas mixtures from supplied gases such as argon, oxygen, nitrogen and carbon dioxide.

Gas mixers and gas mixing systems are used in many industrial and analytical applications where a high volume of gas mixture is needed. Amongst these are protective

atmosphere packaging in the food industry, welding in the automotive industry, glass manufacturing, etc.

This is particularly useful if you have high gas consumption, use rare mixtures or must change the gas composition frequently. Measuring locations can include mechanical pressure gauges such as 213.53 and also pressure sensors such as O-10.

FURTHER APPLICATIONS

DISPENSING SYSTEMS IN PUBS

The design of beer dispensing systems is subject to stringent technical specifications and performance requirements. The pressure gauges are used with regulators to control the flow of beer push gas, i.e. a mixture of CO₂ and N₂.

These can be found in pubs, smaller breweries with bars, restaurants, etc. The customer base ranges from specialised OEM valve manufacturers to service and installation companies within this market.

FIREFIGHTING IN VEHICLES

To prevent fires on buses, caused by engine overheating, modern vehicles are equipped with on-board firefighting systems based on inert gases for fire suppression, water mist and dry chemical extinguishing agents.

Typical customers are manufacturers of automatic fire suppression systems for critical and harsh environments. In these applications the PSM02 pressure switch, for example, can be used.

IIOT PROVIDERS AND TELEMETRY INTEGRATORS

Manual inventory checks are a thing of the past. The telemetry subsegment in the industrial gas market is represented by companies that deliver the inventory level, the pressure and the temperature as data – via connected sensors and a cloud data platform. The customers communicate online with their stocks of compressed or liquefied gas to generate forecasts, set alerts and optimise supply chain costs.

END-TO-END IIOT SOLUTIONS

WIKA offers intelligent sensor solutions to provide answers to global challenges and promote mutual growth in the packaged industrial gases sector.

As the market leader, WIKI has the potential to make data profitable along the entire value chain and develop it as one of the most valuable resources. The WIKI portfolio offers IIoT-capable devices, connectivity and cloud solutions, as well as mobile applications and customised dashboards.

FURTHER APPLICATIONS

GAS CYLINDER BUNDLES

Manufacturers of gas cylinder bundles (also called “cradles” in the USA) are often companies who maintain and refurbish gas cylinders.

The size and pressure of the bundles vary greatly and, thus, also the associated measurement technology: from mechanical pressure gauges up to sensors, transmitters and telemetry.

COMPRESSED GAS TRAILERS

Trailers for compressed natural gas, hydrogen and other industrial gases are assembled from steel and composite high-pressure cylinders. Tube trailers reliably facilitate gas transport through “virtual” gas pipelines. Measuring and other instruments are normally installed at the trailer’s instrumentation panel. The trailer consisting of six tube cylinders, for instance, would normally have 1 pressure gauge, 1 check valve, 1 isolation valve and 1 safety relief valve.

AMBULANCE VEHICLES

OEM manufacturers of ambulance vehicles are involved in the design of on-board oxygen supply systems which must satisfy stringent healthcare requirements.

These on-board oxygen systems not only include high-pressure gas cylinders with regulators but also built-in vacuum suction, monitoring and supply systems to control the stock of required gas.

VACUUM SUCTION UNITS

Portable suction machines or apparatus, also known as aspirators, are used for minor surgery and professional use both in emergency and hospital service. Most commonly, suctioning is done for the removal of secretions from the respiratory tract, but sometimes also for the removal of blood or other materials. Airway suctioning is also performed for diagnostic purposes. Aspirators are also ideal for home post-surgery treatment.

Portable suction units are equipped with overflow valves, suction regulator, vacuum gauge; they can have a disposable filter and a set of disposable tubes.

PUSH-PULL MARKET STRATEGY

To meet the market requirements and learn the technical product requirements, WIKA maintains healthy business relationships with stakeholders in the industrial gas sector.

The peculiarity of the industrial gases market segment is that WIKA's customer base is mainly represented by relevant OEM manufactures – manufacturers of valves, gas supply systems, gas cabinets, cryogenic tanks, protective breathing apparatus, etc.

The major part of all of the industrial gases infrastructure which contains measuring units is used and owned by major industrial gas companies and gas distributors.

That is why their involvement in the start-up phases at WIKA is becoming increasingly important in order to understand the market requirements and the industry standards. In some applications it is feasible to go to such users as fire services, hospitals, beverage distributors or users of welding equipment to learn further specifics about the market.

Knowing the requirements of the end users helps WIKA, on the one hand, to develop a PUSH strategy; and on the other hand, close relationships with the users' OEM suppliers are the basis for a PULL strategy.

CUSTOMER FOCUS AT THE FOREFRONT

WIKA is a customer-oriented organisation.

To approach the market as closely as possible, WIKA conducts dedicated value innovation workshops with its customers. In such a way, WIKA generates ideas on further product development and market adoption requirements for individual customers.

Consequently the ideas collected are processed by one of the specialised development departments at WIKA for customer-specific solutions. This helps to establish good relations with the engineering departments of customer organisations. The lasting relationship with key customers has ensured the transfer and systematisation of knowledge on measuring instruments since WIKA was founded over seventy years ago. This is a solid base for the development of new products.

Even if quality, delivery performance and cost pressure represent hygiene factors in current day-to-day business with industrial gases, with its go-to-market strategy WIKA has confidently started dialogues relating to new, digitally communicating products. Image recognition, Bluetooth data transmission and higher pressure requirements are just a few of the challenges that WIKA has been successfully tackling since the start of the new millennium.
